Created link between individual / group reservation and event reservation.....	6
Link documents to traces	6

Overview

This document describes the major changes and enhancements to IDPMS version 3.15.5. A detailed document on all (technical) bug fixes can be requested with your support department.

Invoice module

The invoice module is added. Making a copy in XML, PDF or print is easier by accessing it directly, with extended search filters.

Possible to store report parameters

When printing a report it is now possible to store 'predefined default values'. (One per report). These parameters will be used by printing in the Nightaudit procedure as well as 'common' print.

Channel management

A new screen is designed to maintain easier the rate codes from the rate grid by having this feature added. Several channels can be defined, having rate types and room types in it. It can be used either to influence the restrictions (only) or to both restrictions and base rate. (field base rate from rate grid. Beware: rate grid must be set up accordingly... can be the other way around)

Separate body when sending email confirmation

It is now possible to configure a separate body when sending the mail directly from IDPMS.

Autorun functions are extended

More features have been added to parameters of the autorun procedure. (night audit procedure). Now once a month for instance some reports can automatically be added to print or store functionality.

Enter / adjust statistics manually

It is possible now to manually enter some statistic values as requested for 'new' hotels that go live with IDPMS during a year. It can also be used for corrections. This module should be handled with supervisory menu rights.

Allotment already calculated from availability

Some hotels want to reduce their availability with the rooms in allotment. With this version it is possible to create it working this way. It cannot be used when virtual room types are used.

Different invoice layouts (with and without logo)

When printing an invoice without logo (for use with brief papier) this invoice is stored without logo. This new feature allows use of invoices with a predefined logo, and choice of which invoice should be used.

Created link between individual / group reservation and event reservation

It is possible to create an event reservation directly from the reservation copying the data already known from the reservation into the event reservation. It can also be used in the confirmation letter. However this needs a review of your confirmation letters.

Link documents to traces

Added to functionality of traces is a link to an (or several) external document. (Whether this is a word document, excel sheet, pdf or text file, etc.)
